

SPACEX
SPATIAL INTELLIGENCE

STEREO IMAGING, TUNED BY EAR

WIDTH. DEPTH. DIMENSION.

Six stages, the Smart dice, a real L/C/R split. Wider, deeper, fuller - and still exactly where the song needs it.

FAST

One click to a finished sound.

LIGHT

Low CPU. Zero latency without LCR.

CLEAN

A real L/C/R split, not just mid-side.

SAFE

Hand-tuned. Nothing you have to undo.

VERSION 1.0.2

THE ONE-MINUTE TOUR.

Goniometer and correlation - it reacts to everything.</p> <p>10 SECTIONS
Six stages, top-left to bottom-right.</p> |
|--|---|

FIRST RESULT IN ONE MINUTE

- 1 Put it on a backing bus, an adlib or an effect return.
- 2 Click the profile until it names your source - Lead Vocal, Backings, Adlibs or Send FX.
- 3 Hit the Smart dice. Listen. Hit it again, until something surprises you.
- 4 Too much? Pull Mix down. Still too much? Click a section name to switch it off.
- 5 Check Mono in the output. If it falls apart, bring Width down a little.

That is the whole workflow. The knobs are there for when you already know what you want.

THE SECTIONS.

Every section: click the name to switch it on or off, Cmd-click to solo it. The lock keeps the Smart dice away.

LCR MATRIX

Splits the image into a real centre and real sides - not just mid-side. Runs while **LCR** is armed in the header, which adds latency. **LCR** sets how much of the centre goes out - the bars show centre and sides, **C-Weight** how firmly the centre is held, **HF Regain** brings back the centre's highs. **EQ** → **LCR** puts the Sides EQ on this split. The icons in the header switch to a frequency view: gold is the centre, blue is left and right.

POLARITY

Flips the phase of the left or right side. **PRE / POST** decides whether that happens before or after Micropitch and Mid-Side - two different sounds. The biggest single change in the plugin, so check Mono.

MICROPITCH

Makes a mono sound wide with tiny offsets in time and pitch. The four styles look simple, but each is its own hand-tuned trick: **Velvet** gentle and close, **Halo** a soft ring that holds up in a full mix, **Illusion** wider than it is but tight, **Double** the widest with the most character. Pick one, turn **Amount**.

MID-SIDE

Width opens or narrows the image - the wedge shows how wide, **Sides** lifts the sides without touching the centre. The Sides EQ curves were picked by ear for real mix problems: **Tight** cleans the lows, **Clear** adds air, **Focus** gives a calmer, brighter centre. The small fader sets how strong - left is gentle.

AUTOPAN

Moves the sound between left and right. The note syncs it to the song, the box sets the length - 1/16 up to 8 bars.

PHASER

Moves the image, not the tone. **Sweep**, **Shimmer**, **Spin** or **Swirl** - then **Amount**. **FAST** runs it quicker, **LINK** makes it follow the Autopan at half its pace.

HEADER, OUTPUT, PRESETS.

SMART PROFILE & SMART DICE

Pick **Lead Vocal**, **Backings**, **Adlibs** or **Send FX**, then roll. The dice builds a complete setting for that source and switches on only the sections that belong. Every range it can reach was tuned by ear. **Undo** takes it back.

LIFE & MOD

Life is how much everything moves - one knob for all modulation. **Mod** switches the modulation off without losing it.

LCR

Arms the L/C/R engine. Off, SpaceX runs with zero latency.

OUTPUT

Mono and **Dry** to check, **Mix** to blend, **Vol** at the very end. **AG** matches the level, so bypass is a fair comparison. Right-click **Mix** or **Vol** to lock them against presets and Reset.

STARFIELD

Your stereo image, live. Click it for the goniometer. The bar at the bottom is correlation - right of centre is mono-safe.

PRESETS

Sorted in folders. The arrows step through the current folder, a star means you changed something, **Save** lets you pick the folder. **A/B** compares two versions.

SETTINGS

Theme, Brightness, LCR On Startup, Show Modulation, Save State as Default - plus the Tour, this manual and the Back Panel. Under **Beta** you find experimental options that may change.

HELP

Click the **?** at the bottom left and hover anything for a short hint.

TIPS

GOOD TO KNOW.

RULE OF THUMB

The more room already sits in front of SpaceX, the further you can push it. Last in the chain is the usual spot. It is not a mastering EQ in disguise - on the master bus only if you know exactly why.

MAKING SPACE

And where there is no room, it makes some. Width, depth and a real third dimension - elegant, and mono-compatible. A mono lead becomes a convincing double that still sounds like a record. Drums, a kick, a mono sub or an 808 gain depth and weight. Space without reverb - more depth, more 3D.

DEMO AND ACTIVATION

Without a serial SpaceX runs as a demo: everything works, but about every 50 seconds the sound goes quiet for a moment. To activate, click the logo and enter your name and serial - the name exactly as in your order.

Thanks to Jeff Ellis, whose words for the forbidden zone and the fourth dimension gave the idea a name.
